Viral Hepatitis: the Search for a Cure

Topic:

Viral hepatitis is responsible for 1.4 million deaths per year from hepatitis-related liver cancer and cirrhosis. Worldwide, 257 million people have chronic hepatitis B and 71 million have hepatitis C. As the 2020 Nobel Prize in Medicine went to scientists who discovered the hepatitis C virus, it is the inventions of novel therapeutics that make elimination of viral hepatitis possible. Dr. Michael J. Sofia pioneered the development of sofosbuvir, a game changing therapeutic cure for hepatitis C. His company is now developing therapeutics for hepatitis B.
